**HOW TO ORDER:** (Refer To Table On Pages 2 & 3)

- Typical ordering code: 10-102-SS-04T-150-RF-XCGYT
- ② – From process connection size (code 10 = 1")
  - ① – From type number (code 102 = flanged seal with threaded diaphragm)
  - ⑨ – From lower housing and diaphragm material (1st S = 316 st. st. diaphragm, 2nd S = 316 st. st. lower housing)
  - ③ – From instrument connection size (code 04T = 1/2npt)
  - ⑤ – If a flanged seal, select flange rating (code 150 = 150 ANSI B16.5 class flange)
  - ⑥ – If for a flanged seal, select flange type (code RF = ANSI B16.5 raised face flange)
  - ⑩ – Diaphragm seal assembly fill fluid & options; precede option code with 'X' (code CG from page 3 = glycerin instrument and seal fill, code YT from page 4 above = top housing 316st. st.)

**NOTES:**

- (1) 5000 psi pressure rating
- (2) 9000 psi pressure rating

## Ten Steps to Select a Diaphragm Seal

### 1 SEAL TYPE

Determine if the diaphragm seal process connection is threaded, flange or in-line to the process. A **threaded design seal** connects directly to the process with a female or male NPT connection. A **flanged design seal** is attached to the process with a flange as specified in ASME B 16.5. An **in-line welded design seal** is suitable for flow-thru applications.

### 2 PROCESS CONNECTION SIZE & TYPE

Select process connection size. If the requirement is for a threaded seal determine if a male or female connection is required.

### 3 INSTRUMENT CONNECTION SIZE

Determine if a 1/4 NPT or 1/2 NPT is required

### 4 DIAPHRAGM TYPE

Is the requirement for the diaphragm configuration threaded, welded, bonded or clamped to the top housing. Design types are:

**Threaded Design:** ensures a positive sealing surface. The diaphragm can be replaced if damaged.

**Welded or Bonded Design:** Metallic Diaphragm- welded to top housing.

Elastomeric Diaphragm: bonded to top housing. Both ensure maximum leak integrity.

**Clamped Design:** available with elastomeric diaphragms only. Diaphragm is clamped between top and bottom housing.

### 5 MAXIMUM ALLOWABLE WORKING PRESSURE

Ensure the instrument full scale range does not exceed the rated pressure of the diaphragm seal. Flanged seal class ratings are in accordance with ASME B16.5. If the diaphragm seal will be used with a differential pressure instrument, the instrument static pressure should not exceed the rated pressure of the diaphragm seal.

### 6 FLANGE TYPE

If the requirement is for a flanged seal, determine if a raised face, flat face or ring joint flange is required

### 7 PROCESS TEMPERATURE LIMITS

When selecting the required system assembly fill fluid, lower housing and diaphragm material, ensure minimum and maximum temperature limits are compatible with the selected fill fluid, diaphragm and lower housing materials. When the requirement is for a flanged seal, refer to ASME B16.5 for pressure and temperature limits.

### 8 TOP HOUSING, FLANGE OR CLAMP RING MATERIAL, CLAMP BOLTS

Consider environmental compatibility when selecting.

**Flanged Type Seals:** Standard flange material is zinc plated carbon steel.

**Threaded Type Seals:** When a clamped ring is offered, standard material is black painted carbon steel.

**Clamping Bolts:** Standard bolt material is zinc plated carbon steel.

See Diaphragm Seal Options page 4 when the standard material is not compatible with environmental conditions.

### 9 LOWER HOUSING & DIAPHRAGM MATERIAL

Both the diaphragm and lower housing are 'wetted parts' and must be compatible with the process media. See [www.ashcroft.com](http://www.ashcroft.com), Technical Information, Corrosion Data Guide for material compatibility. Process temperature limits and concentration are a requirement when selecting lower housing and diaphragm material.

### 10 FILL FLUID

Consider process temperature and process media compatibility when selecting the system fill fluid. A fill fluid other than glycerin is required for vacuum and compound gauge ranges. Glycerin fill is not available when capillary is required between the instrument and diaphragm seal.
